

Google Maps

<https://www.google.com/maps/>

The webpage always leaves most of the screen for the map itself and when you click on things there's a popover or a sidebar on the left. It is very direct and leads you to mostly find directions. You cannot add multiple destinations with most of the options that you pick like public transit or "depart at..." which feels frustrating. You also can't directly compare the routes of walking/transit/driving so it feels like you're not making a choice.

AllTransit Metrics

<https://alltransit.cnt.org/metrics/>

I think the statistics as you scroll down are interesting, but the numbers don't feel like they mean anything without some kind of comparison or visual representation like graphs. Some animations could also make it more fun to read. The stats seem pretty disjointed from the map, so maybe more guidance towards scrolling could help connect it better.
